Ph.D. applicant, Computer and Information Science and Engineering | Syracuse University | Fall 2027

Research Interests

Reliable intelligent software systems; software testing and program analysis; persistent agent execution, failure recovery, and outcome-based evaluation. Wearable and ubiquitous computing as application settings.

Education

University of Melbourne, Australia

Master of Computer Science | 2025-present; expected completion late 2026

Two-year program combining coursework and a research year. Research supervisor: Professor Richard Sinnott. Master's research concerns Android privacy evidence; final results and degree completion are pending.

University of British Columbia, Okanagan campus, Canada

Bachelor of Science in Computer Science | 2020-2024; degree awarded 2024

Capstone Software Engineering Project (COSC 499): 93/100.

Research and Systems Experience

Privacy Lens | Master's research

Research artifact

- Worked on an offline Android privacy-evidence prototype and a curated reproducibility artifact under Professor Richard Sinnott's supervision.
- Organized evidence admission, metric checks, and claim-to-evidence traceability, distinguishing observations from interpretations that require human review.
- Worked with a TypeScript/React Native/Expo application and a Kotlin native layer.

Utopia | Independent systems project

Implementation | Public development and acceptance records

- Led architecture, AI-assisted implementation and integration, and evidence-based acceptance of a system combining persistent task execution with multi-agent orchestration.
- Integrated two physical Windows execution workers with Android and web control interfaces, explicit target-device routing, and inspectable cross-host results.
- Maintained failure histories, task-to-evidence links, and replay records to support debugging and reproducible evaluation.
- This integration is the successor to DS-Hns and Codex Boss.

DS-Hns | Persistent coding-task execution

Public repository

- Designed durable checkpoints and resume checks around workspace state, repository identity, and unfinished effects before interrupted tasks continue.
- Used controlled interruption scenarios to distinguish committed-progress recovery from effect/checkpoint gaps that can still cause duplicate actions.
- Preparing a research manuscript and reproducibility materials based on the project.

Codex Boss | Multi-agent orchestration

Public repository

- Developed workflow orchestration around persistent task contracts, bounded recovery, and deterministic acceptance checks.
- Separated model-reported completion from host-observed evidence; subsequently integrated this work into Utopia.

Technical and Research Practice

- Systems architecture: task lifecycles, interface contracts, durable state, failure handling, and multi-device integration.
- Evaluation: reproducible task scenarios, controlled fault injection, trace inspection, recovery/replay analysis, and evidence-backed acceptance.
- Software practice: JavaScript/Node.js, TypeScript, React Native/Expo, Kotlin/Jetpack Compose, Git/GitHub, and AI-assisted implementation with explicit review.
- Research development: problem formulation, experiment design, artifact organization, and technical documentation.

Selected Academic Preparation

Software Engineering; Capstone Software Engineering Project; Research Methods; Analysis of Algorithms.

Proposed Doctoral Focus

Testing and analyzing intelligent software to determine whether it satisfies intended outcomes under interruption, retries, and changing execution conditions. Interested in combining empirical failure evidence with program analysis and runtime checks, with the specific research problem refined in collaboration with a supervisor.
